U.S. DEPARTMENT OF ENERGY | Nuclear Energy

Light Water Reactor Sustainability:

Nuclear Energy R&D for existing plants

Richard Reister

February 23, 2011

U.S. DEPARTMENT OF ENERGY
Nuclear Energy

LWRS Vision and Goals

Vision

- Enable existing nuclear power plants to safely provide clean and affordable electricity beyond current license periods (beyond 60 years)

Program Goals

- Develop fundamental scientific basis to allow continued long-term operation of existing LWRs
- Develop technical and operational improvements that contribute to long-term economic viability of existing nuclear power plants

- Funding: FY2010 $10.0M
  - FY2011 $28.1M
  - FY2012 $21.4M

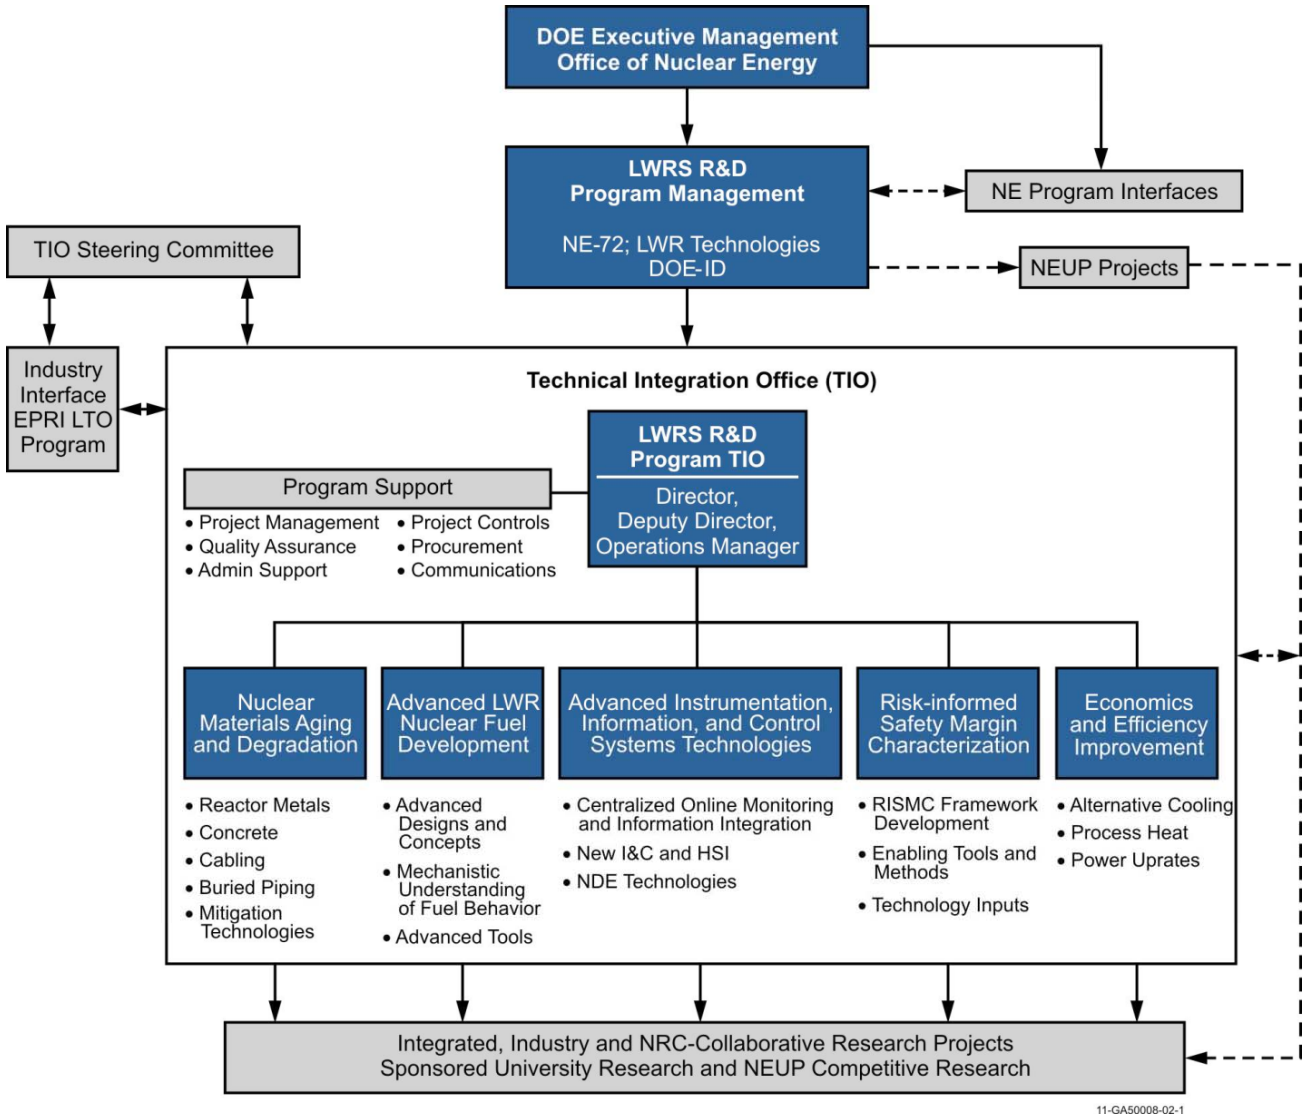
Program Coordination and Management



U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Federal Role

- National strategic interest in the long-term operation of existing plants
  - Supports climate change objectives
  - Supports energy security
  - Avoids higher cost to ratepayers for new plant replacements
- Industry also has an incentive, so cost-share will be employed
- Addresses fundamental scientific questions where private investment or capabilities are insufficient to make progress on broadly applicable technology issues for public benefit
- Government holds a large theoretical, computational, and experimental expertise in nuclear R&D that is not available within the industry
- Benefits will extend to the next generation of reactor technologies still in development

- The Office of Nuclear Energy has signed Memorandum of Understanding with the Nuclear Regulatory Commission and the Electric Power Research Institute to cooperate on R&D related to the long-term operation of existing plants.

Nuclear Energy

Light Water Reactor Sustainability –
Preserving a critical national asset

- **Five LWRS research pathways**

1. **Nuclear Materials Aging and Degradation -** develop the scientific basis for understanding and predicting long-term environmental degradation behavior of materials
2. **Risk-Informed Safety Margin Characterization -** better understand and characterize safety margins and improve the reliability and efficiency of plant operations
3. **Advanced Instrumentation, Information, and Control Systems Technologies -** address long-term aging and obsolescence of existing I&C technologies and establish a strategy to modernize I&C systems
4. **Advanced Nuclear Fuel Development -** develop high-performance, higher burn-up fuels with improved safety, cladding, integrity, and economics
5. **Economic and Efficiency Improvements -** address high impact emerging issues and improve the efficiency of the current fleet

U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Extending service life of today's LWR fleet may create new material challenges

- **The LWRS R&D scope provides the scientific basis for understanding and predicting materials aging and degradation within components, systems, and structures**
  - Reactor metals (RPV's, internals, steam generators, balance of plant, and weldments)
    - Mechanisms of IASCC
    - High-fluence effects on RPV steel
    - Crack initiation in Nickel based alloys
  - Concrete
    - Concrete aging for long term operation
    - Monitoring tools for concrete
  - Buried piping
    - Assessment on long term piping performance
  - Cabling
    - Assessment of cable aging issues
  - Mitigation, repair, and replacement technologies
    - Weld repair techniques
    - Post irradiation annealing
    - Advanced replacement alloys

II&C issues: significant challenges for NPPs over extended lifetimes

- **Fleet-wide benefits of modern control technologies are high but the risks executing large scale modernization are also high because of regulatory and cost uncertainties**

- **R& D Scope:**
  - **Next generation control room, IIC, and automation** – pilot projects
  - **On-line monitoring** – wireless infrastructure and life cycle prognostics
  - **Next generation NDE tools** – detection and characterization of degradation precursors

U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Pilot Project example: Need for Improved Alarm Systems

Current Alarm Systems in Nuclear Power Plants

- Analog systems beyond service lifetimes
  - Fundamental alarm technology developed in 60s-80s
  - Replacement parts difficult to obtain
  - Alarm systems very complex to maintain
- Overabundance of binary state alarm annunciator tiles
  - Typical plant features over 1000 individual alarm tiles
- Ineffective filtering of alarms leads to nuisance alarms that can overload operators
- Digital replacement systems have tended to be like-for-like replacements, not improved systems that intelligently filter alarms or help operator focus on most important alarms

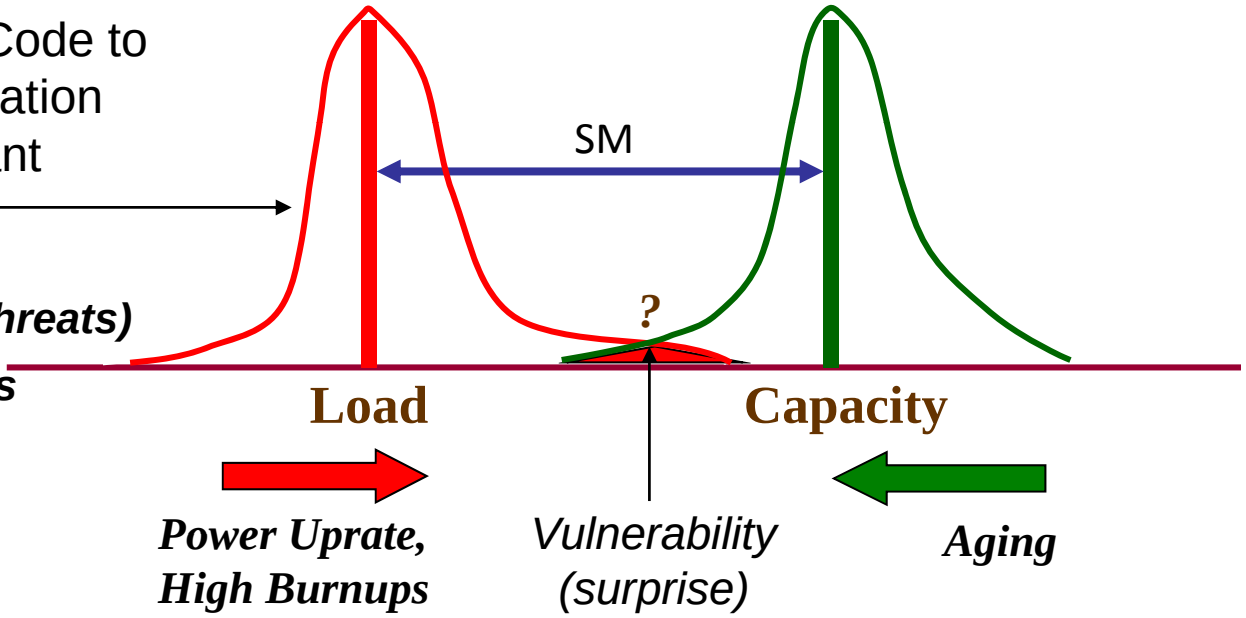
U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Risk-Informed Safety Margin Characterization (RISMC)

Combining Probabilistic and Mechanistic Modeling to provide Integrated Quantification of Uncertainty

Area 1: Develop RELAP7 Code to Enable Plant System Simulation and Computation of the Plant Probabilistic Loads

- ✓ ***System analysis (multiple threats)***
- ✓ ***Tightly couple multi-physics***
- ✓ ***Coverage of scenarios***
- ✓ ***Computational efficiency***
- ✓ ***Appropriate model fidelity***



Area 2: Develop a risk-informed margin-based framework for construction of LWR plant life extension "safety case"

Area 3: Incorporate (aging) SSCs into a Plant Risk Model. Integrate RISMC with Materials Aging R&D

U.S. DEPARTMENT OF ENERGY
Nuclear Energy

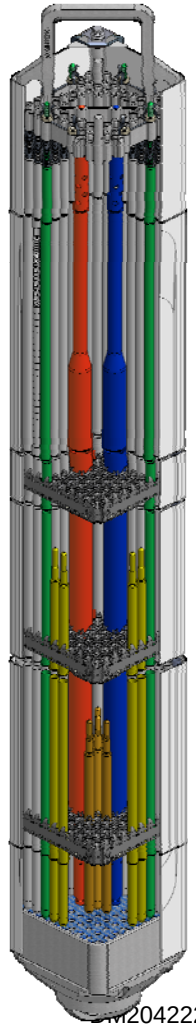
Advanced Nuclear Fuels

Goals:

- Improve the fundamental scientific understanding and prediction of the behavior of nuclear fuel pellets, cladding, and the fuel-coolant system under extended burn-ups for normal and transient conditions
- In public-private collaborations apply this information developing and demonstrating very advanced fuels with improved safety margins, and potential for higher fuel burn-ups and performance
- Develop predictive tools for advanced nuclear fuel performance
- Speed implementation of new fuel technologies to industrial application

Specific planned activities:

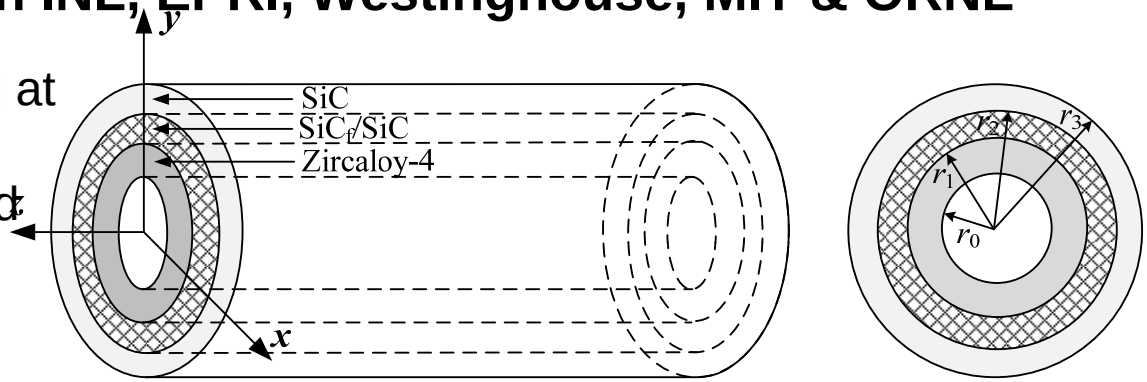
- Begin the development of new long-life fuel designs with advanced fuel and cladding materials
- Develop predictive tools of advanced nuclear fuel performance
- Develop a model for fuel cracking at the mesoscale level with sufficient understanding to develop a predictive model for fission gas release

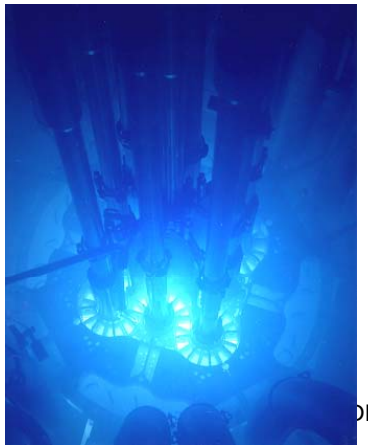


U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Ceramic Composite Cladding (SiC) Development

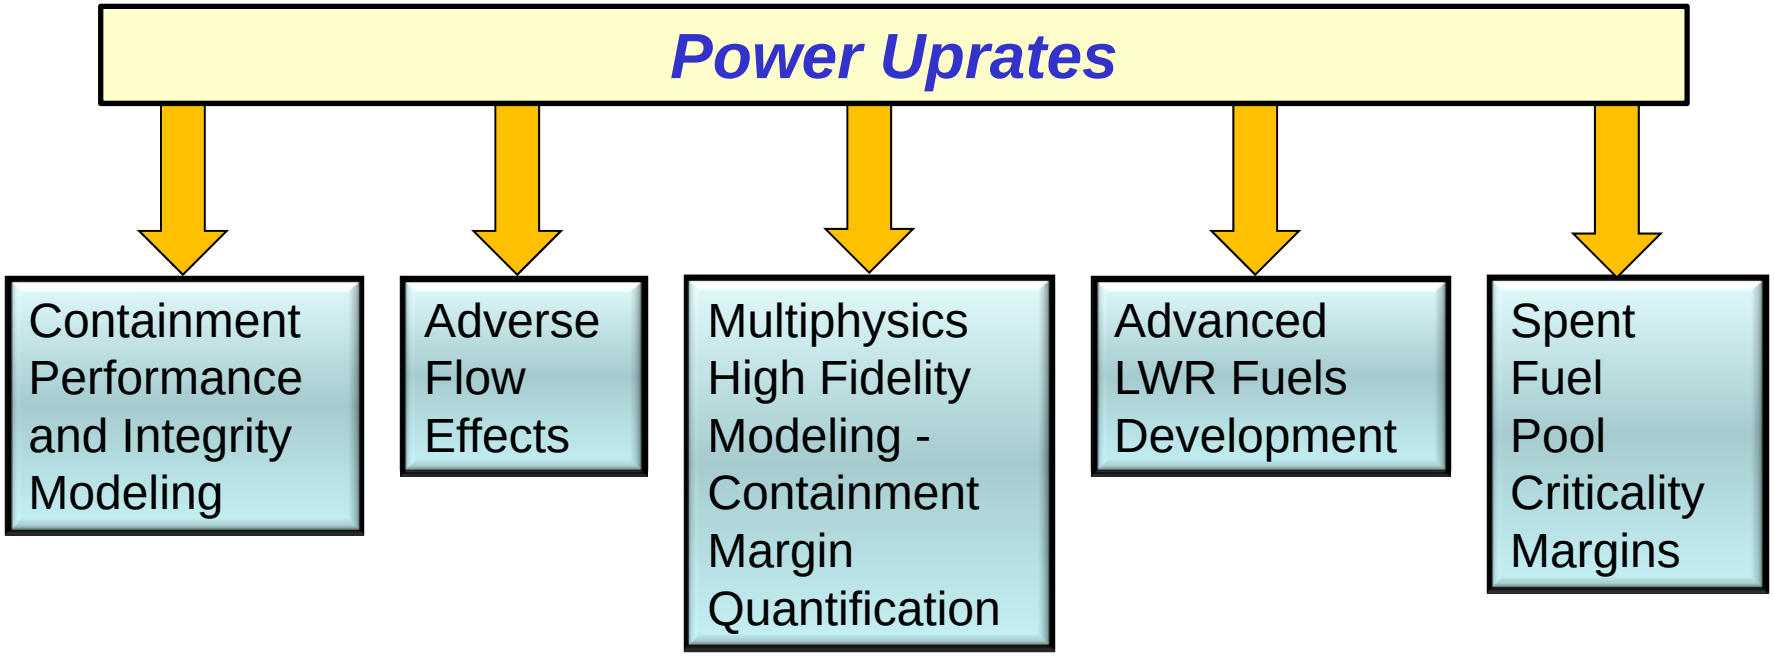
- **Collaborative efforts with INL, EPRI, Westinghouse, MIT & ORNL**
  - Fueled irradiations on-going at HFIR for ceramic matrix composite clad with UO2 and UN based on MOX testing samples
  - ATR irradiations planned for unfueled and fueled experiments in FY-11
  - Start of Halden Reactor Project irradiation planning in FY-11
  - MIT PWR coolant experiment planning in FY-11





U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Economics and Efficiency Improvement



Goal: Facilitate power uprates for operating LWRs – identify, investigate obstacles and resolve issues that inhibit potential power uprates in aging fleet

U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Pilot Plant Projects

- **Ginna**
  - Containment assessment
    - *Fiber optic strain gage measurement of tendon relaxation*
    - *Coring and subsequent spectroscopy and strength testing*
    - *Rebar condition assessment*
    - *NDE (test various methods)*
    - *Digital Image Correlation trial*
  - Augmented Reactor Internals Aging Assessment (baffle bolts)
  - RPV embrittlement
    - *Reconstitute specimens*
    - *Irradiate further*
    - *Re-test to expand vessel embrittlement database*
- **Nine Mile Point Unit 1**
  - Investigate top guide cracking
  - Other activities TBD
- **Zion D&D**
  - Concrete Specimens
  - RPV Specimens
  - Other Specimens TBD

U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Conclusion

- The existing fleet of nuclear power plants provide the majority of the Nation's non-carbon emitting electrical generation
- The continued operation of the existing fleet is in the National interest as a key strategy for meeting climate change and energy supply goals
- Federal efforts are essential to stimulate and encourage industry efforts as well as to address the longer-term, high risk research that industry can not address
- Sustained R&D on long-term LWR operations is needed to identify issues and develop the technical basis that supports industry efforts to relicense plants for long-term operation
